

A scatter plot showing the relationship between the true final velocity (V_x in km/s) and the predicted final velocity (V_x in km/s). The x-axis is labeled V_x (km/s) and ranges from -2 to 3. The y-axis is unlabeled but ranges from -2 to 2. The legend indicates that black dots represent 'True Final Vel' and red asterisks represent 'Pred Final Vel'. A thick black curve is fitted to the 'True Final Vel' data, showing a parabolic shape with a minimum around $V_x \approx 0.5$ km/s. The 'Pred Final Vel' data points are scattered below the curve, indicating a systematic under-prediction of the final velocity.
